Re: Class 3 Groundwater Demonstration Report
Copano Enterprises LLC, dba CE Ranch LLC, Copano Site (Beds 1-4)
Aransas and San Patricio County, Texas
9019 Settlement Agreement effective May 21, 2018
TCEQ SWR No. 30097; EPA ID No. TXD008129983
Customer No. CN605550557; Regulated Entity No. RN104914312

Ms. Wehner,

Please find enclosed two copies of the Class 3 Groundwater Demonstration Report prepared by Golder Associates Inc. for Copano Enterprises LLC, dba as CE Ranch LLC, Copano Site.

Unless otherwise directed and in accordance with your letter of June 10, 2019, CE Ranch LLC will submit the Affected Property Assessment Report on or before June 30, 2020 using the enclosed report as a basis to assess site groundwater.

Please contact me with any questions you may have.

Sincerely,

Ronald M. Morosky
Operations Manager

Enc.

1.0 INTRODUCTION AND BACKGROUND

1.1 Background

Copano Enterprises LLC (dba CE Ranch, LLC in Texas) (CE) owns and operates the Copano Property (the Site), in San Patricio and Aransas Counties, Texas (Figure 1-1). CE and the Texas Commission on Environmental Quality (TCEQ) entered into a 9019 Settlement Agreement (the Agreement) on May 21, 2018 that outlines environmental and other requirements, including requirements related to Site groundwater.

A Revised Preliminary Groundwater Assessment Report was prepared by Golder Associates Inc. (Golder) and submitted to the TCEQ on May 3, 2019 (Golder, 2019a). The report described the procedures/results to address the groundwater assessment requirements of the Agreement. A Revised Drinking Water Survey Report submitted to the TCEQ on May 24, 2019 (Golder, 2019b) documented that no privately-owned drinking water wells were located within 0.25-mile radius of the Site. The TCEQ approved these documents in a letter dated June 10, 2019 and requested the submission of an Affected Property Assessment Report (APAR) for the Site.

1.2 Objective

Groundwater resource classification is a necessary component of the APAR for Sites managed under the Texas Risk Reduction Program (TRRP). Per the guidance document “Groundwater Classification” (TCEQ Publication RG-366/TRRP-8), the results of the groundwater classification for all affected groundwater-bearing units (GWBUs) and threatened hydraulically-interconnected GWBUs shall be submitted for TCEQ review in the APAR. However, per RG-366/TRRP-8, the TCEQ encourages submittal of groundwater information used to support a Class 3 classification prior to full completion and submittal of the APAR, ensuring early TCEQ concurrence with a Class 3 groundwater classification and avoiding delays and remobilizations for additional assessments, revision of the APAR, and duplication of work. This Class 3 Groundwater Demonstration report is intended to address that objective and documents the results of the groundwater classification in the format suggested in Section 2.9 of RG-366/TRRP-8.

1.3 Copano Property Description

The Site is bordered to the north and east by Copano Bay and Port Bay, respectively (Figure 1-1). State Highway 136 traverses north-south through the center of the property. From 1972 until 2016, bauxite residue was pumped to the Site via pipelines from an alumina refinery located approximately 10 miles to the south on Corpus Christi Bay.

The Copano Property consists of more than 11,000 acres. There are four separate surface impoundments (designated Beds 1, 2, 3 and 4) at the Site, covering approximately 3,100 acres (Figure 1-2). The dikes of the impoundments were reportedly constructed of native clays sourced from shallow excavations on the property, and keyed into the underlying approximate 20-ft thick surficial clay layer.

The groundwater monitoring network at the Site currently consists of 34 permanent monitoring wells. Twenty-five of the wells were installed prior to 2018 and are completed in the uppermost water-bearing unit (Zone A). Nine additional wells (MW-3RB, MW-5B, MW-6RB, MW-7B, MW-11B, MW3-4B, MW3-7B, MW4-3B, and MW4-7B) were installed in 2018 and are completed in Zone B (Figure 1-2, Table 1-1).

1.4 Environmental Setting

The topography of the area is relatively flat. The land surface elevation, prior to construction of the impoundments, ranged from 6.9 feet (ft) MSL near Port Bay to 14 ft MSL on the western limit of the property. Drainage is generally to the east towards Port Bay. The approximate elevations of the top of the bed dikes are as follows:

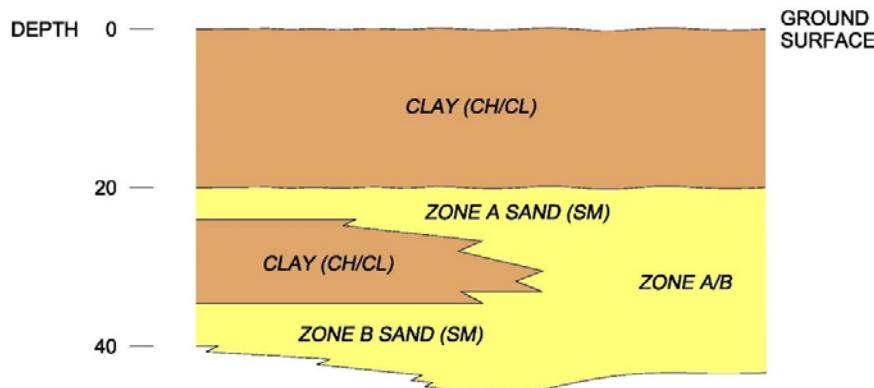

- Bed 1 - 29.5 ft MSL
- Bed 2 – 30 ft MSL
- Bed 3 - 32 ft MSL
- Bed 4 – original elevation at 39 ft MSL; dike repair that began in 2019 has lowered this height to 36 ft MSL

Given the proximity to the estuaries of Port Bay and Copano Bay, some marsh lands exist on the Site. In addition, several small lakes are present, some formed through excavation of clay material from on-Site borrow areas for dike construction.

2.0 IDENTIFICATION OF GROUNDWATER-BEARING UNITS

Investigations at the facility have provided information about the Site subsurface geology and hydrogeology. In general, subsurface strata are part of the Quaternary (Pleistocene) Beaumont Formation, which consists of mostly clay, silt, sand and gravel deposited in stream channel, point bar, natural levee, and backswamp depositional environments. Subsurface complexity arises due to the interbedded nature of these deposits and reflects the various depositional environments of the Beaumont Formation. Multiple sand units are present in the subsurface that are typically separated by clays (i.e., confining units).

The surface soil observed at the Site is a medium to high plasticity clay that extends to a depth of approximately 20 feet below the ground surface (bgs). Beneath this surface clay is the uppermost GWBU (Zone A) that varies in composition from a silty to clayey sand, ranges in thickness from just a few feet to over 20 feet, and typically contains interbedded clay and silty clay. A deeper GWBU (Zone B) is present beneath Zone A and a clay confining unit (ranging from a few feet to over 10 feet thick). Zone B, typically represented by silty sand and less frequently as a clayey sand, also varies in thickness from a few feet to over 20 feet. Occasionally, the clay unit between Zones A and B is absent resulting in a thick sequence of sand with interbedded clay and silty clay and represented as Zone A/B. The subsurface stratigraphy is shown on the generalized section below.

Geologic cross-sections were prepared using available stratigraphic data (Figures 2-1, 2-2 and 2-3) and show the multiple interbedded sand and clay units described above.

Groundwater in Zones A and B occur under confined conditions, i.e., the water level in a well is at a higher elevation than the top of the water bearing unit at that well location. Lateral groundwater flow in the upper water-bearing units ranges from toward the northeast to southeast towards Copano Bay and Port Bay. Potentiometric surface maps for Zones A and B prepared from water-level gauging data collected on February 4, 2020 are provided as Figures 2-4 and 2-5, respectively.

Zones A and B are generally separated by a significantly thick clay layer and in these instances are not likely to be hydraulically interconnected. However, as noted above, occasionally the clay layer is not present and the zones are hydraulically interconnected as Zone A/B.

Hydraulic slug tests were conducted on four wells (two in Zone A, two in Zone B) to estimate the hydraulic conductivity of the GWBUs. For Zone A, the estimated hydraulic conductivity ranged from 7.0×10^{-4} centimeters per second (cm/s) to 1.6×10^{-3} cm/s. For Zone B, the estimated hydraulic conductivity ranged from 1.2×10^{-4} cm/s to 3.9×10^{-4} cm/s.

The potential for groundwater discharge to adjacent surface water bodies was considered using the stratigraphic and hydrogeologic data. Where data were available, the relationships between the uppermost GWBUs and adjacent surface water bodies (Port Bay, Swan Lake, Freshwater Lake) were added to the Site cross sections (Figures 2-1, 2-2 and 2-3). As shown on the cross sections, the uppermost GWBU does not intersect the surface water bodies. Rather, there is typically a minimum of approximately 4 to 5 feet of clay between the bottom of the surface water body and the top of the GWBU, and often as much as 7 to 8 feet of clay.

3.0 CURRENT USE AND GENERAL HYDROGEOLOGIC CONTEXT

Water well records obtained through the Texas Water Development Board (TWDB) and Banks Environmental Data, Inc. (Banks) were reviewed to identify the potential location of water wells within a 0.5-mile radius of the perimeter of Beds 1-4 and the Decant Pond. Well location and designated use information obtained from the TWDB and Banks was reviewed and verified by Golder personnel in the field to the extent possible. Many of the wells identified in the Banks report (Attachment 1) are either incorrectly mapped in the database with actual locations greater than 0.5 miles from the affected property or were not observed on the ground at the reported location (presumably abandoned, destroyed, plugged, etc.). A summary of Golder's review of the Banks records and other information is provided in Table 3-1. A map of water well locations is provided as Figure 3-1.

Three water wells were identified within a 0.5-mile radius of the affected property. These wells (State ID 79-63-802, 79-63-801 and 136832) are registered to Copano Enterprises LLC and are located on the Copano Property (i.e., on the 11,000-acre ranch property). These wells are not used for potable purposes.

No water wells were identified within 0.5-mile radius of the affected property that supply groundwater for human consumption, agricultural purposes or any purpose which could result in exposure to human or ecological receptors.

4.0 NATURAL WATER QUALITY

Five groundwater sampling events from all 34 monitoring wells have been performed at the Site. Total dissolved solids (TDS) analysis was performed during each event and exceeded 10,000 mg/L for each sample (Table 4-1) with one exception (from well MW-1, 8,280 mg/L, sample collected 9/20/2018). Concentrations of TDS in samples collected from Zones A and B monitoring wells averaged 34,204 and 40,218 mg/L, respectively. In addition, groundwater quality at well locations farthest upgradient in Zones A and B (see Figures 2-4 and 2-5, respectively) were further assessed with regard to background conditions. The arithmetic mean of the TDS data reported for MW-9 (Zone A) for the five sampling events is 18,960 mg/L and the arithmetic mean of the TDS data reported for MW-5B (Zone B) for the five sampling events is 23,180 mg/L. These data exceed 10,000 mg/L and meet the naturally-occurring criteria for a Class 3 groundwater resource.

The natural salinity in Zone A/B groundwater is due to several potential factors:

- Presence of intruded seawater or connate sea/bay water deposited with the native sediments;
- Historical infiltration of wind-driven sea/bay water aerosols;
- Historical inundation by sea/bay water; and/or
- Concentrating effects of evapotranspiration.

The cation and anion data for the monitoring well samples were plotted on a trilinear (piper) diagram (Figure 4-1). Review of this figure indicates that the geochemical signature of Site groundwater is very similar across all samples/wells given the close grouping of the data on the diagram. This indicates that there is no variability of the source of the natural salinity for all the groundwater samples collected from the wells at the Site.

5.0 GROUNDWATER RESOURCE CLASSIFICATION

RG-366/TRRP-8 states that a Class 3 groundwater resource designation is applied for GWBUs where: i) the natural TDS concentration exceeds 10,000 mg/L, and where: (ii) there is no human or ecological exposure to groundwater from that GWBU within 0.5-miles. Results of the groundwater resource classification evaluation for the Site as detailed in the previous sections of this report indicate that the uppermost GWBUs at the Site (Zones A and B) meet the criteria for a Class 3 groundwater resource, as defined by TRRP Rule §350.52(3) and consistent with RG-366/TRRP-8, for inclusion in the APAR.

Notes:

1) State Plane Coordinates, NAD 83, Texas South Zone (unless otherwise noted)

2) NAVD 88 Datum (unless otherwise noted)

3) ft MSL - feet Mean Sea Level

4) ft. TOC - feet below top of casing

5) As constructed data taken from available boring logs or GHD, 2017

6) in. - inches

7) Total depths were measured by Golder on 4/18/2018 and 10/29/18.

8) Data for wells completed prior to 2018 was collected from various sources and cannot be verified.

Notes:

1) See map in Banks Report, Attachment 3
 2) Distance to nearest monitoring well where a sample exceeded a PCL for a COPC.

3) Location Method:

GPS-PP₄ - GPS coordinates, Pathfinder Office P.P.

AddMat - Address Matching

Map - Map Interpolation, Digital

NA - Coordinates were not able to be obtained

4) Horizontal Datum:

NA - Coordinates were not able to be obtained

84 - World Geodetic System 1984 (WGS 84)

5) Horizontal Accuracy:

P - Less than 2 meters

Q - Within 2 to 5 meters

U - Unknown

NA - Coordinates were not able to be obtained

6) Horizontal Reference:

WH - Wellhead

DR - Private driveway at the road

SC - Site center

NE-CL - Northeast corner of land parcel

E-CL - East corner of land parcel

S-CL - South corner of land parcel

NA - Coordinates were not able to be obtained

Notes - See additional comments regarding why the location was taken at a particular spot

7) Well Type:
 Prv - Private. Well meets definition of private drinking water well in Texas Water Code, Section 26.408, and guidance document RG-428.

S - Stock

U - Unknown

Prv* - No appropriate well type available. Well is on private property and is not used for drinking water.

Prv** - No appropriate well type available. Well is on private property owned by Copano Enterprises LLC and is not in use.

8) Well Status:

O - Well is operational

C - Well is capped according to TDLR Rules

U - Well status is unknown

9) Well Use:

Non-Drinking Water

Drinking Water

Note: Copano Enterprises LLC has confirmed the wells on their property are not used for drinking water.

10) ft BGS - feet below ground surface

11) Aquifer Method:

X - Aquifer Code assumed from geographic location

D - Interpretation of Driller's Log

12) Address/contact information of well owner(s) and/or user(s) has been updated to reflect current property owner(s) information, as possible. Shaded cells indicate address/contact information of well owner(s) and/or user(s) was provided by the Banks well reports and is unable to be verified.

13) The Aransas County Groundwater Conservation District (ACGCD) was created by the 84th Texas Legislature and was running as a temporary organization in 2015. In 2016, county voters rejected the creation of a permanent Groundwater Conservation District

Dataset Descriptions and Sources

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
TX HGSD - Texas HGSD	Harris Galveston Subsidence District/Fort Bend Subsidence District	This dataset contains all groundwater well records compiled by Harris Galveston Subsidence District/Fort Bend Subsidence District.	Quarterly	08/13/2018	04/19/2018	04/22/2018	04/19/2018
TX TCEQ HIST - Texas TCEQ Historical	Texas Commission on Environmental Quality	This dataset contains all historical water well records searched from the TCEQ Public Water Well Viewer. Banks Environmental Data plots each well record based on location information found on the log.	As requested	N/A	N/A	N/A	N/A
TX TCEQ PWS - Texas TCEQ PWS	Texas Commission on Environmental Quality	This dataset contains a collection of records from Texas Water Districts, Public Drinking Water Systems and Water and Sewer Utilities who submit information to the TCEQ.	Quarterly	08/13/2018	04/18/2018	04/22/2018	04/18/2018
TX TWDB GW - Texas TWDB Groundwater Database	Texas Water Development Board	This dataset contains water well records contained within Texas Water Development Board Groundwater Database.	Quarterly	04/20/2018	04/20/2018	04/22/2018	04/19/2018
TX TWDB SDR - Texas TWDB Submitted Drillers Reports	Texas Water Development Board	This dataset contains water well records from the Texas Water Development Board Submitted Drillers Reports Database.	Quarterly	04/17/2018	04/17/2018	04/22/2018	04/16/2018
WW USGS - USGS Water Wells	U.S. Geological Survey	This dataset contains groundwater well records from the U.S. Geological Survey.	Semi-annually	06/06/2018	06/06/2018	06/10/2018	06/06/2018

Disclaimer

The Banks Environmental Data Water Well Report was prepared from existing state water well databases and/or additional file data/records research conducted at the state agency and the U.S. Geological Survey. Banks Environmental Data has performed a thorough and diligent search of all groundwater well information provided and recorded. All mapped locations are based on information obtained from the source. Although Banks performs quality assurance and quality control on all research projects, we recognize that any inaccuracies of the records and mapped well locations could possibly be traced to the appropriate regulatory authority or the actual driller. It may be possible that some water well schedules and logs have never been submitted to the regulatory authority by the water driller and, thus, may explain the possible unaccountability of privately drilled wells. It is uncertain if the above listing provides 100% of the existing wells within the area of review. Therefore, Banks Environmental Data cannot fully guarantee the accuracy of the data or well location(s) of those maps and records maintained by the regulatory authorities.
